Executive summary

This report assesses the traffic and parking aspects of the development application for Darkinjung Aboriginal Land Council at Kooroowall-Undi (Peat Island), Mooney-Mooney. The application proposes various tourism activities, including a cultural centre, café, water-based tours facilitated by a jetty, and associated parking and access infrastructure.

To assess the impact, a SIDRA analysis was undertaken based on background traffic counts with additional traffic generation from the proposed activities derived by first principles. Both day-to-day operation and an event scenario are considered. Overall, minimal traffic impact is expected at the four relevant intersections analysed and no traffic upgrades were identified as required within the surrounding local road network.

A parking assessment found that the parking proposed exceeds the requirements of the *Central Coast Development Control Plan* (Central Coast Council, 2022) ("the DCP") and staff operational requirements. The DCP requirements only related to some aspects of the proposal; the additional provision is considered suitable to service the tourism activities (e.g. water-based tours) which are not addressed by the DCP. The 8 bicycle parking spaces required by the DCP are absent in the proposal, but easily incorporated within the detailed design phase. The swept path analysis and parking geometry were generally satisfactory, noting that the loading area is limited to a Small Rigid Vehicle size, and two blind aisles are to be resolved in detailed design.

1 Introduction

Mott MacDonald has been engaged by Darkinjung Aboriginal Land Council to provide multidisciplinary services supporting the Development Application (DA) for the Kooroowall-Undi (Peat Island) site at Mooney Mooney. As part of those services, this report assesses the development proposal for parking suitability and traffic impact on the surrounding external road network.

The DA seeks approval for a new tourism and visitor facility, including cultural facility, café, jetty and caretaker's accommodation. Specifically, it seeks approval for:

- Adaptive reuse of the former Burrumbilla office/administration building into an information and education facility and caretaker's accommodation.
- Adaptive reuse of the former dairy and secondary store buildings as a café with indoor and outdoor seating.
- A new jetty.
- Vehicular access and car parking.
- Stormwater and drainage works.
- · Construction of utility services.
- Landscape works.

The activities on the site are proposed to include:

- Information and education facilities operating between 8:30am and 10pm, 7 days a week, although 9am to 5pm is likely more typical.
- The café with up to 80 seats, operating between 8am and 8pm, 7 days a week.
- Water-tours operating from the jetty, including oyster tours, Peat Island tours and a river cruise.
- Vehicular access and car parking areas including required road upgrades, associated site landscaping and signage. 112 car parking spaces are proposed in 5 new bays and 1 existing bay retained. A total of 16 of the 112 car parking spaces will be accessible.

The proposed layout is shown in Figure 1.1.

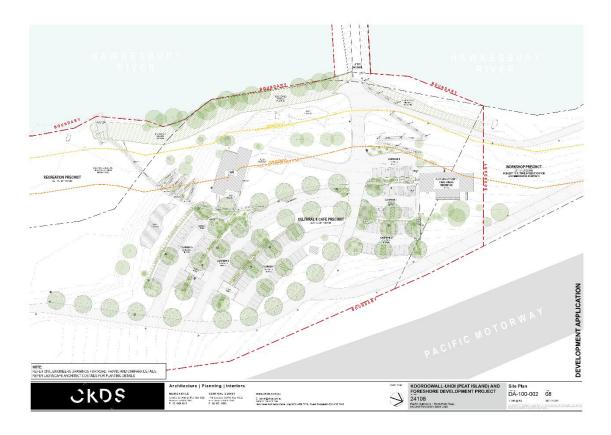

Figure 1.1: Site Layout

Source: Kooroowall-Undi (Peat Island) and Foreshore Development Project Site Plan DA-100-002 (CKDS Architecture, 2024).

2 Traffic Impact Assessment

The development site is located on the western site of the M1 Pacific Motorway, with direct access from the Pacific Highway. On- and off-ramps from the Pacific Motorway to the Pacific Highway to the south provide broader access, while the Pacific Highway provides access to the rest of Mooney Mooney and adjacent village of Brooklyn. While Peats Ferry Road not directly involved in accessing the site, its intersection with the Pacific Highway to the south of the site is relevant.

The following sites are considered relevant to access for the site and have been assessed for potential traffic impacts:

- Pacific Highway / Old Pacific Highway: a priority intersection with give-way signs controlling the western approach.
- Peats Ferry Road / Pacific Highway: a roundabout.
- Pacific Highway / M1 SB Ramps: usually a priority intersection controlled by a stop-sign on its western off-ramp approach. Signals are present here but only activated during times of high demand.
- Pacific Highway / Site Access Road a priority intersection between the existing unnamed internal road within the site and the Pacific Highway.

The road network and relevant intersections are illustrated in Figure 2.1. Detailed intersection layouts are presented in Section 2.1.3.

Figure 2.1: Surrounding road network and assessed intersections.

Aerial Source: SIX Maps

2.1 Methodology

The traffic impact assessment has been undertaken in SIDRA 9.1 to estimate intersection performance. Background traffic has been estimated using counts undertaken in September 2018. These traffic counts were increased by 2% p.a. compounding growth, to conservatively estimate 2024 flows as the basis of assessment, presented in Attachment A with the original traffic counts. The following peak periods were modelled:

- AM weekday peak hour: 06:30 07:30.
- PM weekday peak hour: 15:00 16:00
- Sunday weekend peak hour: 11:30 12:30.

While the AM peak does not coincide with the proposed operating hours, it was assessed along with the PM and Sunday peaks as a conservative approach. The assessment considers three scenarios:

- 2024 Base, with only background traffic, for AM, PM and Sunday peak hours.
- 2024 with Development, representing day-to-day operation with traffic related to the proposed formal parking, for AM, PM and Sunday peak hours; and
- 2024 Event Egress sensitivity test, representing the end of a small music festival held on site, unbound by the amount of formal parking.

2.1.1 Traffic Generation

The additional traffic from day-to-day operation of the development has been estimated by first principles, based on the proposed formal parking, with the following assumptions:

- 112 parking spaces as per the development proposal, assuming full occupancy:
- A maximum 2-hour duration of stay, averaging about 1-hour duration of stay, given the proposed land uses and activities proposed for the site.
- Thus, 50% of the formal 112 parking spaces are expected to turnover within the hour.

This results in 56 movements in and 56 movements out, to be applied additional to the background traffic within the observed peak hours.

For the event egress sensitivity, a theoretical event involving 250 vehicles was tested. It is assumed that these vehicles will egress across the hour after the conclusion of an event. The event traffic replaces the day-to-day demand, rather than being additional to it.

Both scenarios are assumed to have the same distribution of generated traffic across the considered road network, as assumed in the *Mooney Mooney Planning Proposal Appendix J: Traffic and Transport Assessment (Mott MacDonald, 2021)*, as follows:

- 30% to/from the North
- 70% to/from the South
- 70% use the M1
- 30% use the Pacific Highway

The resulting paths and traffic movements are shown Figure 2.2 and Figure 2.3.

Figure 2.2: Development Traffic Distribution - Ingress

Aerial Source: SIX Maps

Figure 2.3: Development Traffic Distribution - Egress

Aerial Source: SIX Maps

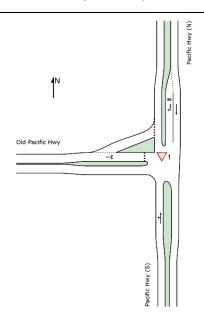

2.1.2 Performance Measures

The key performance measures from the SIDRA analysis for comparison across the scenarios are as follows:

- Average Vehicle Delay (seconds) for each movement, which are summarised to the intersection level:
 - For priority intersections (stop, give way and roundabouts) by the worst performing movement.
 - For signalised intersections, by the average across all movements
- Level of Service (LoS) categorises the average delay into thresholds from LoS A (good performance) through to LoS F (poor performance), at both the movement and intersection levels.
- 95th percentile queue lengths, which should be less than the approach length to avoid queues impacting upstream intersections or impeding motorway operation.

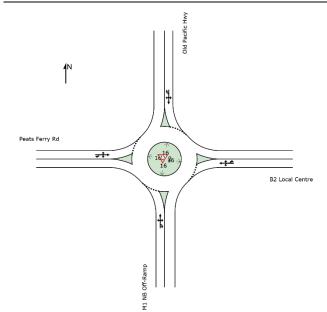

2.1.3 Modelled Layouts

The SIDRA models were configured to resemble the existing arrangement across all scenarios. The modelled layouts are presented below in Figure 2.4 through Figure 2.7, with commentary.

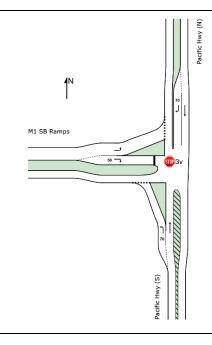

- Give-way controlled t-intersection.
- Right of way for north-south traffic, with the western approach right turn controlled by a give way sign, and the left turn operating as a merge.

Figure 2.4: Intersection 1 - Old Pacific Highway / Pacific Highway

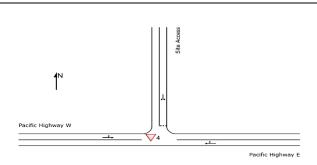

- Simple 4-way roundabout.
- Western approach serves as access to existing parkland, jetties, and car parking at Deerubbun Reserve.
- Eastern approach serves as site access to Hawkesbury River Ambulance Station

Figure 2.5: Intersection 2 - Peats Ferry Road / Old Pacific Highway

- This intersection generally operates under priority, with the western right turn controlled by a stop sign and the western left turn controlled by a give-way sign.
- Otherwise, the northern and southern approaches have right of way.
- Western approach connects directly to the M1 Pacific Motorway via a long on-ramp.
- Although signals are installed, they only operate occasionally. Given the low volumes and good performance of the site under priority control, only the priority control case is presented.

Figure 2.6: Intersection 3: Pacific Highway / M1 Southbound Ramps.

- This intersection provides is the access point to the site from the external road network
- The northern approach currently operates as a driveway, giving way without being controlled by a give-way sign.
- The eastern and western approaches have right of way.

Figure 2.7: Pacific Highway / Site Access

2.2 SIDRA Results

The results of the SIDRA analysis are compared below for each peak across the scenarios at the intersection level. Detailed results are provided in Attachment B. Given the minimal pedestrian flows recorded by the traffic counts at intersections and the general road environment of the network, only vehicle movement results are presented.

2.2.1 2024 AM Weekday Peak

Table 2.1 compares the performance of the four assessed intersections during the AM Weekday Peak Hour across the three scenarios tested. All the intersections considered are unsignalized, so the intersection performance is determined by the worst movement. All intersections (and therefore all movements) operate at LoS A, with only minor worsening impacts from the development during day-to-day and event egress scenarios. Additionally, queue lengths are minimal and well within the approach lengths.

Table 2.1: AM Weekday Peak Hour intersection performance – all scenarios.

A	M Peak Hour	2024 E	ase		2024 w	/ Deve	lopment	2024 E	vent E	gress
Si	te Name	Max Avg. Delay	LoS	Max 95th% Queue	Max Avg. Delay	LoS	Max 95th% Queue	Max Avg, Delay	LoS	Max 95th% Queue
1	Pacific Highway / Old Pacific Highway Priority	6.7s	A	0.3m	6.6s	A	3.7m	6.5s	A	9m
2	Peats Ferry Road / Pacific Highway Roundabout	11.7s	A	2.3m	11.7s	A	3m	11.7s	A	2.8m
3	Pacific Highway / M1 SB Ramps Priority	10.2s	Α	2.4m	10.8s	Α	0.9m	12.2s	Α	3.6m
4	Pacific Highway / Site Access	5.8s	Α	0.1m	6s	А	1.3m	5.9s	Α	5.6m

2.2.2 2024 PM Weekday Peak

Table 2.2 compares the performance of the four assessed intersections during the PM Weekday Peak Hour across the three scenarios tested. All intersections (and therefore all movements) operate at LoS A, with only minor worsening impacts from the development during day-to-day and event egress scenarios. Additionally, queue lengths are minimal and well within the approach lengths.

Table 2.2: PM Weekday Peak Hour intersection performance – all scenarios.

P	M Peak Hour	2024 B	Base		2024 v	/ Deve	lopment	2024 E	vent E	gress
Si	te Name	Max. Avg. Delay	LoS	Max. 95th% Queue	Max. Avg. Delay	LoS	Max. 95th% Queue	Max. Avg. Delay	LoS	Max. 95th% Queue
1	Pacific Highway / Old Pacific Highway Priority	7s	A	2.8m	7s	A	4.5m	7s	A	1.4m
2	Peats Ferry Road / Pacific Highway Roundabout	10.8s	A	3.4m	10.8s	A	4.2m	10.8s	A	4.6m
3	Pacific Highway / M1 SB Ramps Priority	10.3s	Α	1.3m	10.9s	Α	1.7m	12.3s	Α	3.8m
4	Pacific Highway / Site Access	6s	Α	0.1m	6.3s	Α	1.5m	6.2s	Α	5.7m

2.2.3 2024 Sunday Weekend Peak

Table 2.3 compares the performance of the four assessed intersections during the Sunday Peak Hour across the three scenarios tested. All intersections (and therefore all movements) operate at LoS A, with only minor worsening impacts from the development during day-to-day and event egress scenarios. Generally, queue lengths are minimal and well within the approach lengths.

One exception is the Pacific Highway / Old Pacific Highway queue length, which extends to 29m on the western approach during the Sunday Event Egress. However, the approach length here is ~180m (between this intersection and the site access intersection), indicating that this queue length is not problematic.

Table 2.3: Sunday Peak Hour intersection performance – all scenarios.

S	unday Peak Hour	2024 E	Base		2024 v	/ Deve	lopment	2024 E	vent E	gress
Si	te Name	Max. Avg. Delay	LoS	Max. 95th% Queue	Max. Avg. Delay	LoS	Max. 95th% Queue	Max. Avg. Delay	LoS	Max. 95th% Queue
1	Pacific Highway / Old Pacific Highway Priority	8.5s	A	8.2m	9.1s	A	11.6m	10.6s	Α	29m
2	Peats Ferry Road / Pacific Highway Roundabout	11.2s	A	7.1m	11.3s	A	8.1m	11.2s	A	7.1m
3	Pacific Highway / M1 SB Ramps Priority	13.9s	Α	5.4m	14.9s	В	6m	17.7s	В	1.1m
4	Pacific Highway / Site Access	6.6s	Α	0.1m	7.3s	Α	1.7m	7s	Α	6.4m

2.3 Assessment Summary

The SIDRA analysis indicates that the combination of the parking quantum and activities proposed would have minimal impact on the surrounding road network, noting the traffic counts and assumptions that produce this outcome. Consequently, no intersection upgrades are expected to be required.

3 Parking

This section discusses the car parking, bicycle parking and other parking arrangements proposed by the development application. The following parking facilities:

- 112 car parking spaces in 5 new bays and 1 retained existing bay
 - Of these, 16 spaces are arranged for universal access.
- An approximately 50m long bus parking bay.
- A loading zone in the parking bay adjacent to the Cafe
- · Various circulation roads.

Additional details informing the parking assessment include:

- The café is ~160m² GFA, as measured from built form in the provided plans, and could have up to 80 seats, as advised.
- The cultural centre building is ~360m² GFA, measured from plans. This is building is partially
 occupied by the caretaker's accommodation. The area related to the cultural centre explicitly
 has been estimated at ~240m².
- Staffing numbers have been advised by ADW Johnson.

3.1 Parking Requirements

3.1.1 Car Parking

The proposed parking provision has been compared with the Central Coast Development Control Plan 2022 (Central Coast DCP) chapter 2.13, setting out Council's car and bicycle parking requirements. The DCP does not address the requirements of the tourism activities proposed, but the following aspects of the development have been assessed for parking requirements:

- Caretaker's Residence, considered a dwelling;
- The Café, considered as a restaurant; and
- The cultural centre, considered as a community centre.

The requirements associated with the above parts of the development are summarised in Table 3.1.

Table 3.1: DCP car parking requirements.

Land Use	Rate	Scale	Parking Requirement
Caretaker's Residence	Dwellings - 1 space per dwelling for dwellings with 3 or fewer bedrooms	1 dwelling	1 space
Cafe	Restaurant – the greater of: 15 spaces per 100m ² 1 space per 3 seats	~160m ² GFA 80 seats.	30 spaces 27 spaces
Cultural Centre	Community Centre – 1 space per 20m²	~360m² GFA minus caretaker accommodation: ~240m² estimated	12 spaces.

Additionally, the following staff numbers are expected, likely requiring a parking space given the location of the site:

- 1 caretaker already assigned a parking space as in Table 3.1.
- 3 information/ office workers associated with the cultural centre.
- 5 café staff.
- Up to 8 staff for water-based tours.

Thus, a further 16 spaces are required for staff parking. This allocates 59 spaces in total, from either the relevant DCP requirements or expected staff operations, leaving 53 spaces to accommodate additional demand from the water-based tours. Overall, the parking provision is seen as appropriate because:

- It fulfils the DCP and staff requirements.
- It provides additional parking for the water-based tour activities which are unspecified by the DCP.
- Visitors are likely to link trips between the water-based tours.
- As demonstrated by the traffic impact assessment, it is not expected to adversely affect the external road network.

Further detail on the scale of the water tours and vehicle occupancy assumptions would allow provide another sense check on the suitability of the car parking provision. However, this was not available at the time of assessment.

3.1.2 Accessible parking rates

The Central Coast DCP refers to the Building Code of Australia (BCA) for the required provision of accessible parking. Considering the proposed spaces as primarily Class 6, for car parks up to 1000 spaces, 1 accessible space for every 50 spaces is required. The proposed provision of 16 accessible spaces exceeds this requirement.

3.2 Bicycle Parking

The Central Coast DCP also sets out minimum bicycle parking requirements for short- and long-term use, as summarised in Table 3.2.

Table 3.2: Short- and long-term bicycle parking requirements – Central Coast DCP.

Land Use	Short Term		Long-Term	
	Rate	Requirement	Rate	Requirement
Community Facility	1 space per 200m ²	2	1 space per 200m². Min 2 spaces.	2
Restaurants	2	2	1 space per 100m ² of public area.	2

To meet the requirements of the Central Coast DCP, 4 short-term and 4 long-term bicycle parking spaces. These are currently not included within the design, but could easily be incorporated at the detailed design stage, as a condition of consent.

3.3 Parking Geometry Check

A parking geometry check was undertaken against AS2890.1 for general parking and AS2890.6 for accessible parking, finding the following:

- All general spaces are designed at 2500mm x 5500m, compliant with AS2890.2. This is consistent with Class 2 parking allowing for full opening of doors and single manoeuvre entry and exit. This is generally used for long-term public parking (e.g. town centres, entertainment centres) and considered is suitable given the expected duration of stay.
- Aisle widths are ~6m, exceeding the 5.8m aisle width required for Class 2 parking.
- The blind aisle extension required in AS2890.1 Clause 2.4.2. However, the length of the blind aisles does exceed the 6 space-length maximum for car parking open to the public (Clause 2.4.2c). A turnaround facility is recommended to allow vehicles to exit the blind aisle section, to be incorporated at the detailed design stage.
- Accessible parking spaces are compliant with AS2890.6, with a shared space for unloading between each pair of parking spaces. Accessible paths are provided between the parking, the café and the cultural centre. Currently an accessible path down to the jetty has not been achieved.
- The bus parking bay provided is suitable for 2 buses, although they will not be able to move independently of each other.

3.4 Swept Paths

Swept path assessments were undertaken, with the drawings presented in Attachment C. The exercised assessed:

- B99 passenger vehicles (defined in AS2890.1) manoeuvring through the car park;
- 12.5m bus manoeuvring to the bus parking.
- Medium Rigid and Short Rigid Vehicles (defined in AS2890.2) manoeuvring to loading spaces.

The swept paths were generally satisfactory with most identified issues resolved in the design process. However, the loading area proposed in front of the café cannot fit an MRV, while an SRV works. This limits the size of servicing vehicles, which should be considered against their likely size.

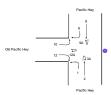

4 Conclusion

The SIDRA results, informed by the increased background traffic counts and first-principles parking-based traffic generation, indicates the proposed development will have minimal impact on the surrounding road network. All intersections and movements operated within LoS A, and the impacts of the day-to-day operation and the event egress sensitivity test were minor, maintaining good performance in LoS A. 95th percentile queue lengths also were unproblematic.

The parking assessment found some relevant requirements within the Central Coast DCP and identified that the proposed car parking provision meets the DCP and operational requirements. The proposal exceeds the requirements for car parking, providing additional parking capacity for the tourism activities, which are difficult to derive parking demand for. The proposal lacks 8 bicycle parking spaces required by the DCP, but easily incorporated within detailed design. A swept path analysis and parking geometry check were generally satisfactory, although there is a non-compliance with the blind aisle length in two parking bays to be resolved in detailed design and the loading area is limited to an SRV vehicle size.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA gueue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA gueue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Roundabout Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Options

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA (TWSC): Level of Service is not defined for major road approaches or the intersection as a whole for Two-Way Sign Control (HCM LOS rule).

Two-Way Sign Control Capacity Model: SIDRA Standard.

Delay Model: SIDRA Standard (Control Delay: Geometric Delay is included).

Queue Model: SIDRA queue estimation methods are used for Back of Queue and Queue at Start of Gap.

Gap-Acceptance Capacity Formula: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Arrival Flows used in performance calculations are adjusted to include any Initial Queued Demand and Upstream Capacity Constraint effects.
